

Calibration Error Worksheet

CM3215 Fundamentals of Chemical Engineering Lab
 Prof. Faith Morrison

The error e_s is defined as the "best-case" standard error for a quantity as determined for a brand-new unit by a manufacturer or for a particular device by someone with authority to certify the value. For example, the technical specifications of a device may indicate that it is accurate to a value $\pm 2e_s$. Alternatively, a value of a constant (the viscometer constant α , for example) may be provided by the manufacturer with no specific uncertainty. In this case, the rule of thumb method of "least significant digit" is acceptable for evaluating the uncertainty. Finally, a user may take steps to calibrate a meter on site; this determination of error (likely to be greater than the "best case" error) has the advantage of reflecting issues associated with the particular unit in question.

Measured quantity:	Symbol:	Representative value: (include units)	Estimate of e_s : (or Not Applicable)
Rigorous Method: Manufacturer maximum error allowable	$2 e_s \approx$		
Rule of Thumb Method: Least significant digit varies by at least $\pm 1 = \pm 2e_s$			
Method 3: User calibration	$2e_s \approx$		
Maximum of Methods 1 - 3	$e_s =$ $2e_s =$		95% CI, Calibration error only: quantity $\pm 2e_s$ (units)

Table 1: Tolerances for Volumetric Glassware (from Fritz and Schenck, *Quantitative Analytical Chemistry*, Allyn and Bacon, Inc, Boston, 1987 or www.thomassci.com)

Capacity, ml	Maximum error allowable, $2e_s$			
	Pycnometers (Thomas Scientific)	Volumetric flasks	Volumetric Pipets	Burets
5	0.03	-	0.01	0.01
10	0.04	-	0.02	0.02
25	0.05	0.03	0.03	0.03
50	0.08	0.05	0.05	0.05
100	-	0.08	0.08	0.10
500	-	0.15	-	-
1000	-	0.30	-	-

Table 2: Tolerances for Laboratory Meters

meter	Maximum error allowable, $2e_s$	reference
Thermocouple, type J or K, standard limits	$2.2^\circ C$	www.omega.com /techref/colorcodes.html
Thermocouple, type J or K, special limits	$1.1^\circ C$	www.omega.com /techref/colorcodes.html
RTD (Resistance Temperature Detectors)	Up to $0.01^\circ C$ with proper calibration	IEC751 Standard
Honeywell STD924 DP meter, 0-1000mbar	0.075% of calibrated span	ST 3000 Smart Pressure Transmitter Models Specifications 34-ST-03-65

Reading Error Worksheet

CM3215 Fundamentals of Chemical Engineering Lab

Prof. Faith A. Morrison

This worksheet guides the user through the determination of the standard reading error and 95% confidence limits for the reading of a scale or from a digital readout. The standard reading error $e_{s,reading}$ may be used in propagation of error calculations of derived quantities.

Device name:			
Reading error, e_R :	Measured Quantity: (give symbol)		
	Representative value:	(include units)	Quantity, or Not Applicable
	issue	contribution to error	
	Sensitivity (from manufacturer or rule of thumb)	How much signal does it take to cause the reading to change?	1
	Resolution: limitation on marked scale or digital readout	Half smallest division or decimal place	2
	Fluctuations with time of observation	(max-min)/2	3
		Maximum of 1, 2, & 3:	$e_R =$
Standard reading error:	$e_{s,reading} = e_R / \sqrt{3}$		(units)
	95% Confidence Interval based on reading error:		(units) $\pm 2e_s =$

Note: If a quantity is supplied by, for example, a manufacturer, with no indication of the uncertainty, we do not use this worksheet. Instead, see the Calibration Error worksheet.

Rule of thumb for sensitivity: 1 (optimistic) or 15 (pessimistic) times the last retained digit. The optimistic choice assumes any minor change is sensed; the pessimistic choice assumes that the manufacturer has displayed two uncertain digits.
